Why choose Reznor?

With more than 125 years of experience in gas heating and air conditioning, Reznor manufactures a wide range of industrial and commercial HVAC solutions. Founded in 1888 in Pennsylvania, Reznor is a global leader thanks to its innovative and economical solutions for heating, cooling, ventilation and air quality.

Product Offering

Reznor VRF condensers are available in 6, 8 and 10 Tons. These base model condensers can also be combined to make systems with capacities ranging from 6

Tons all the way up to 20 Tons. Indoor unit combinations range from 13 indoor units all the way up to 36 indoor units. The minimum and maximum number of indoor units is determined by the system's connectable capacity. The connectable capacity range for heat pump systems is 50% to 135% of the capacity rating of the outdoor unit. The connectable capacity range for heat recovery is 50% to 150%. The collective capacity rating of indoor units must fall within the connectable capacity range for the system to function correctly.

Variable Refrigerant Flow (VRF) Technology

What is VRF?

Variable Refrigerant Flow (VRF) systems move refrigerant to multiple indoor fan coil units, each with its own control. This allows building occupants to meet their individual comfort needs without the energy loss associated with moving air through ductwork.

Reznor VRF systems are inverter-driven, allowing the system to soft start and consume less energy. Reznor VRF systems also modulate capacity according to demand, using the least amount of energy possible to meet the heating and cooling needs in specific areas.

VRF systems provide the ultimate in comfort, design flexibility, simple installation and energy savings:

- Excellent payback potential
- True zone control
- Minimized installation costs (no large ductwork; no cranes; no large bundles of piping and wire)
- Very quiet operation

Where can VRF be used?

VRF systems can be used anywhere separate zoning and energy savings are priorities:

- Schools and Universities
 Healthcare Facilities
 Day Care Centers
- Hotels
- Office Buildings
- Apartments
- Retail Strip Centers
- Museums
- Airports

- Renovation and Additions

Modular Design Flexibility

Outdoor condensers can be used individually or easily linked in a wide variety of combinations from 6 to 20 (6 to 30 Heat Pump only) tons. Seven different indoor unit styles in capacities ranging from 7K BTU to 60K BTU allow for thousands of combinations to suit any décor and accommodate almost any commercial application.

Combine units for a maximum of 20 Tons (30 Tons Heat Pump only)

Wide Operating Temperature Range

Reznor VRF systems have one of the widest temperature operating ranges in the industry, allowing for low ambient cooling down to 23°F (-5°C) and low ambient heating all the way down to -4°F (-20°C).

Modular Design Flexibility

3280ft (1000m) Pipe Design

The simple piping design means Reznor VRF systems can be installed in a variety of building types. It also makes installation easy which reduces installation costs.

- Maximum 3300ft (1000m) of piping [see note]
- Maximum 541ft (165m) pipe length from the outdoor unit and the furthest indoor unit
- Maximum height from indoor unit and outdoor unit is 295ft (90m)

Note: 3280ft(1000m) is the total system piping length in one direction. The maximum piping length from the first branch to the farthest indoor unit is 131ft(40m).

Ultra Long Connection Pipe for More Convenient Installation

By adding a subcooler, with built-in subcooler circuits, the indoor and outdoor unit(s) can operate reliably with longer connection pipe.

		NO.
	Competitive Models	Reznor Mini
Total Piping	500ft	393ft
Length	150m	120m
Equivalent Piping	225ft	492ft
Length	70m	150m

Wide Range of Zone Applications

Three outdoor units can be combined with up 36 indoor units for a greater number of individual zone comfort levels.

Modular Design Flexibility

High Static Pressure

The system has four settings of static pressure that can be set up to .33" wc (82Pa). This design is especially useful when an outdoor unit needs to be placed indoors.

Seasonal Settings

The system can be set to cooling only or heating only mode if desired. This option can provide safety and increased energy savings.

Key-Card Control

For hotel applications Reznor offers a key card controller. When the key card is inserted the unit is ON. When key card is removed the unit is OFF. If the key card is removed the settings are stored in memory.

Simple Installation

When compared with conventional systems of the same capacity, Reznor VRF units are smaller and lighter for easier installation. The smaller size also allows for easier movement around job site. There's no need to hire expensive cranes or forklifts. Units can be transported to the roof via elevator.

Lighter Weight and Compact Design

Smaller, modular design of the outdoor unit allows for units to be carried to the roof via elevator. A conventional outdoor system would require a crane.

Easy Transportation

Base Frame Rails

Built-in base rail frame makes for easy lifting and installation with a hoist, and easy transportation with a forklift.

Simple Installation

Flexible Wiring

There is no polarity requirement, so common sheath twisted pair cable can be used saving time and money and simplifying installation.

Non-Polar CAN Technology to Improve Communications

An industry first. Non-polar CAN communication provides quicker system response time reducing service time and providing more reliable data.

Performance Index	Competitive Models Multi-VRF Network	Reznor DC Inverter CAN Network		
	Software check	Hardware check, more reliable		
Reliability	One unit's communication error will shut down the entire system	If one unit has error, it will exit from the network without affecting other units		
Communication Efficiency	Low performance	High performance		
	Communication speed is about 10Kbps	Communication speed is about 20Kbps		
Compatibility	One main network, difficult to add new equipment	Multiple networks, easy to add new equipment		
Communication Distance	3280ft (1000m)	4921ft (1500m)		

Simple Installation

Auto Addressing of Outdoor Unit and Indoor Unit

Debugging software is used for auto-addressing of outdoor and indoor units. It can detect indoor unit and outdoor unit quantity and automatically allocate addresses. System can emit an audible tone in a specific indoor unit for easy identification by a technician.

Intelligent Debugging for Convenient Installation

- Automatic recognition of indoor unit and outdoor unit locations
- Automatic detection of the number of indoor unit and outdoor unit quantity
- Automatic detection of error signal
- Automatic troubleshooting startup
- Real-time analysis of pipe error signal
- Audible tone sounds on indoor unit for troubleshooting

Intelligent Defrosting Design

The Reznor system uses an intelligent learning mode to sense when defrosting is required. This improves performance and increases energy efficiency.

Conventional system will engage defrost mode at set intervals. This affects the efficiency and performance of the system and reduces the comfort level of the occupants.

Refrigerant Storage and Distribution

These units are designed without a liquid receiver, instead the system uses the piping for refrigerant storage, which in turn provides better refrigerant control, and lowers the amount of refrigerant necessary to run the system.

Sub-Cooling Control Technology

The control system ensures a full column of liquid to all indoor unit expansion valves. The primary method shown (below top) ensures 20°F (11°C) liquid subcooling to the indoor units. The condenser also has a secondary subcooling technology that assures a 16°F (9°C) liquid subcooling in any weather condition (below bottom). And in heat recovery systems, each Mode Exchange Unit has its own subcooling circuit, ensuring a full column of liquid to the units calling for cooling.

In all weather conditions the indoor units will have proper liquid refrigerant available for heating or cooling.

Quiet by Design

Reznor VRF outdoor units have two modes for quiet operation.

Quiet Night

The Quiet Night mode can sense the ambient temperature setting and automatically adjust to quiet mode during the cooler night time temperatures. There are nine different settings under Quiet Night mode.

Forced Quiet

In Forced Quiet mode the system can be set at constant quiet operation. The sound level can be set as low as 45dB(A).

Quiet Control

The new fan bossing structure is designed to reduce vibration. The sound level can be reduced by 3dB(A).

Aerodynamic 3D Axial Fan

The aerodynamic axial fan was designed to increase airflow volume by 12%. More air is moved at lower power, increasing efficiency and reducing sound level.

Quiet Indoor Operation

The indoor unit system also uses DC inverter motors to realize stepless regulation. The sound level can be as low as 22dB(A).

Fast Start-Up Heating

The DC inverter compressor can be powered on and operated at a high frequency to produce more heat more quickly.

Seven Indoor Unit Fan Speeds

The optional wired controller has settings for seven fan speeds from low to turbo. Simply press the "FAN" button to select the desired fan speed.

High-Efficiency Energy Saving and More

With the advance all DC inverter optimized system design and accurate, intelligent control, the IEER of the this system is up to 28.1.

Efficiency Definitions

Coefficient of Performance (COP): a measure of efficiency that compares energy input to energy output at one temperature

Energy Efficiency Ratio (EER): a measure of efficiency that compares the energy consumption and output at a few temperatures rather than one

Simultaneous Cooling and Heating Efficiency (SCHE): the energy efficiency of a unit that uses the same system to both heat and cool; used exclusively with heat recovery systems.

Integrated Energy Efficiency Ratio (IEER): the most accurate efficiency rating; shows how a system performs at varying loads

How do we stack up?

EER shows a more accurate picture of efficiency than COP. However, it is calculated using indoor units that are running at a fairly high load. So, like with COP, companies can engineer their equipment to meet EER specifications to produce better numbers, but it does not offer the most accurate real world rating

We exceed expectations in arguably the most important area – value. SCHE and IEER are considered more accurate ratings for variable-capacity systems. SCHE is used exclusively with heat recovery systems and is the whole basis for purchasing a heat recovery system. IEER is the most accurate rating and shows how efficient a system is when it does not need 100% capacity, which is almost ALL the time. If you compare our ratings to competitors, we would be considered middle-of-the-pack. However, because we offer our units at a more competitive price point, the efficiency differences seem negligible.

Energy Saving Operation Control Options

Though Reznor VRF systems offer tremendous energy savings in standard operation mode, the system is equipped with two additional selectable energy saving modes.

In auto energy-saving mode, the system will adjust itself based on operation status to lower electricity usage up to 15%.

In compulsory energy-saving mode, the system will automatically restrict power consumption by up to 20%. This means you spend less and keep more in your pocket.

What is a Compressor High-Side Pressure Chamber?

High-Side Shell Scroll Compressor

The low-temperature and low-pressure refrigerant gas from the suction inlet of the compressor will change to high-temperature and high-pressure vapor after compression. Then the vapor will exit at the center of fixed scroll to the lower chamber of compressor, so that the compressor chamber is in high pressure.

What are the benefits of a High-Side Shell?

The High-Side shell design forces oil into the plates using pressure. The greater the pressure difference, the more oil is forced onto the plates, meaning that the compressor always has the lubrication it needs. Compressor discharges directly in to the shell of the compressor creating improved compression efficiency.

All DC Inverter Technology to Improve Compression Efficiency

All DC inverter compressor and high-performance high-side shell compressor are adopted to reduce overheat suction loss and improve compression efficiency from direct intake. Compared with low pressure chamber, the compression efficiency is improved. High-efficient permasyn motor is adopted to provide better performance than traditional DC inverter compressor.

Sensorless DC Inverter Fan Motor

Stepless speed regulation ranges from 5 Hz to 65 Hz. Sensorless control produces less vibration, lower sound

Accurate Intelligent Allocation of Capacity

When total load demand is more than 75% of an energized module capacity, the next module will automatically start. When total load demand drops below 40% of energized modules capacity, one module will automatically shut off. Each unit shares 40%-70% of the total load.

Testing shows that this is the most efficient operational range.

Intelligent Fan Cycling Ensures Highest Efficiency

The DC inverter compressor and DC inverter fan also share the load for more energy savings.

Temperature Controlled by Wired Controller with Higher Efficiency and More Energy Saving

Through setting temperature lower limit in cooling or dry mode, and setting temperature upper limit in heating, 3D heating or heat supply mode, the system is able to operate in a smaller temperature range so as to achieve energy saving.

Soft Start Means Smaller Impact to Power Grid

The startup frequency of the inverter compressor is gradually increased from 0Hz to the required operation level. Lower load torque means lower amp draw. Inverter compressors use less energy during start up than traditional compressors. The electromagnetic impact is also reduced. Since the locked rotor amps (LRA) are negligible, it reduces the stress placed on the power supply, as well, particularly in generator or alternative energy applications.

Internal Components

Top-Discharge VRF Dual Compressor Motors

Top-Discharge VRF Single Compressor Motor

Rotation Operation Maximizes Life Span

When multiple units are combined, one unit will be the primary operating unit. As increased heating/cooling is required, additional units will be energized. After 8 hours of operation the system will automatically change the primary unit to another module. By spreading operating time over the different modules, the lifespan of the entire system is increased.

Through 10 years of research and development every component has been improved including electrical components, mechanical parts, controls and communications technology.

Two-Stage Oil Separation Control Technology

The first stage will separate 98% of the oil from the refrigerant. The second stage will remove 95% of the remaining oil. This results in an overall 99.9% removal rate.

Oil Return Control

New Oil Return Control

The system effectively controls system oil return and oil storage of each compressor greatly improving the life of the compressors.

For the 0.1% of oil that does make into the refrigerant piping and indoor units, after a certain amount of runtime at certain conditions, the system will perform its Oil Return function, returning the oil to the outdoor unit, where it belongs.

Specialized Compressor Oil Storage Control

Specialized compressor storage control maintains a minimum amount of oil for compressor operation.

Oil storage status before oil return

Oil return operation

Oil storage operation

Oil Balance Control Technology

Oil Balance Between Each Module

Based on the actual status of each module and compressor, the system can regulate compressor operation and maintain oil balance of each module.

Oil Balance Between Each Compressor

Refrigerant is taken into the compressor by the suction pipe and then runs through the cooling system. It can control the oil level and minimum oil volume required by each compressor so as to maintain oil balance between each compressor.

Intelligent Detection Control

Pressure Sensor Detection Control

The pressure sensor can precisely detect system high and low pressure. It will adjust fan and compressor operation to make sure the system operates at the most energy efficient pressure condition.

Temperature Sensor Detection Control

Several temperature sensors detect the ambient temperature, indoor temperature and refrigerant evaporating temperature. From this information the unit will adjust to operate at optimum efficiency.

Multi Electronic Expansion Valve Control

Outdoor electronic expansion valves (EXV) not only have throttling effect, but also control refrigerant flow. The system adopts multi-electronic expansion valves control with a total of 960 grades regulated by two EXVs. This regulates the refrigerant flow precisely and ensures reliable operation.

The outdoor units have two Electronic Expansion Valves (EEV's). One is used during heating operation to regulate the refrigerant flow to the outdoor coil (evaporator in heat mode). The other EEV is used during cooling operation to regulate the floor to the subcooling circuit in the outdoor unit. The EEV's have 480 steps of control.

Prioritization of Emergency Operation

Reznor outdoor units can sense when electrical power supply is interrupted and a backup generator is engaged. The units can be set to continue to operate under low-voltage conditions. Priority can be assigned to certain spaces and the system will continue to operate at the highest capacity it can.

ERROR

Emergency Operation

When a single unit of a multi-module system is damaged, the other units will perform at emergency operating levels as needed to sustain the building load.

Likewise, when a single compressor in a single unit fails, the others will perform at increased levels.

In dual fan units, a single fan can continue to operate if the other fails.

An error code will be displayed to let the building occupants know that there is a problem but the units will continue to operate, depending on the failure.

Easy Maintenance and Service

Auto Refrigerant Recovery

During maintenance auto refrigerant recovery function is set and shutoff valve is closed. The compressor, EXV, solenoid valve and fan, etc. will automatically operate. To be environmentally friendly, the refrigerant is captured at the condensing side of the outdoor unit. The system low pressure signal will be displayed.

VRF units feature both "pump-down" and "pump-out" operations for easy maintenance. Pump-down is used for maintenance or repair on the indoor-side of the system, while pump-out is used for maintenance or repair of the outdoor unit.

Inspection Window

For quick inspection of system operation an inspection window is available, saving time and the effort required to remove the front panel.

V5 Outdoor Units

V5 Outdoor Unit Nomenclature

V5 Mini Heat Pump 3, 4 & 5 Ton

V5 Heat Pump 6, 8 & 10 Ton

V5 Heat Recovery 6, 8 & 10 Ton

Residential/Light Commercial Multi-Zone Systems

Reznor VRF Mini multi-zone systems offer condensers in 3, 4 and 5 tons. These are stand-alone condensers that can be combined with a minimum of 1 and up to 9 indoor units. The minimum and maximum number of indoor units is determined by the system's connectable capacity. The connectable capacity range for heat pump systems is 50% to 135% of the capacity rating of the outdoor unit. The collective capacity rating of indoor units must fall within the connectable capacity range for the system to function correctly.

V5 Mini Internal Components

Efficiency - Reduced Energy Usage Saves Money

All DC Inverter Compressor

This Mini VRF System uses inverter compressor technology. By changing the displacement of compressor, stepless capacity regulation within range of 10%~100% can be realized. Various models are provided with capacity range from 3 to 5 tons (nominal), which can be widely used in residential, commercial and working area and especially applicable to places with big load change.

Wired Controller Allows for Higher Efficiency and Energy Savings

By setting temperature lower limit in cooling or dry mode, and setting temperature upper limit in one of three available heat modes, the system is able to operate in a narrower temperature range to achieve greater energy savings.

Sensorless DC Inverter Fan Motor

The indoor unit has a high-efficiency brushless DC motor, which is 30% more efficient compared to conventional motors.

Emulation software in the logic of the indoor unit maximizes the efficiency of the evaporator.

High-efficiency Digital PFC Control*

High-efficiency Power Factor Correction (PFC) control technology improves efficiency by about 1% compared with conventional PFC. For the air conditioner with rated power of 18,000 BTU, 50W of electricity can be saved every hour and 1,200W of electricity can be saved every day.

* This feature is applicable for V5 Mini outdoor units only.

Wider Operation Range in Cooling Mode

The DC motor has more accurate high pressure control, which effectively solves the high pressure control problem in low ambient temperature cooling.

Compressor Closed-loop Startup Technology Provides More Reliable Startup

The closed-loop startup control technology means less current is required, and startup is more reliable. (Applies to V5 Mini outdoor units only)

High Anti-Interference Ability

The latest CAN bus technology uses non-polar communication with high anti-interference prevention. Common communication wire can meet the communication demand with no need of specialized shielding.

Intelligent Temperature Control

Intelligent temperature control technology is used for super fast heating/cooling.

Fast Cooling

Quiet Outdoor Unit

The advanced sub-cooling control reduces the liquid flow noise of indoor unit in cooling operation.

The sound of the outdoor unit can be as low as 45dB thanks to sound optimized design of the fan and compressor system. There are several quiet mode settings.

Quiet Indoor Unit

The patented centrifugal fan and fan casing reduce sound level by as much as 22dB(A).

The entire fan assembly was designed so that it is placed at the optimum angle. Also the ratio between the internal and external diameters allow for the maximum amount of airflow at minimum sound levels.

The advanced supercooling control and oil-return technology (in heating mode) combine to provide a quieter flow of liquid to the indoor unit.

When comparing decibel levels of competitive equipment, remember that an increase of 10dB can be perceived as twice as loud. This is especially important when comparing noise levels of refrigerant distribution boxes.

For comparison purposes, rustling leaves have a decibel level of 20. A whisper in a quiet library from 6 feet away has a decibel level of 30.

Noise Levels - BC verses MEU

A difference of sound as little as 10dB can be perceived as being twice as loud. BC Controller Solenoid noise during mode change up to 56dB. Single Port BS Box during mode change as little as 35dB.

BC Controllers

BS Boxes

Non-Commutative Oil Return Technology in Heating

The unit can achieve non-commutative oil return in heating when outdoor ambient temperature is within 32~68°F (0~20°C). Thanks to this technology, indoor ambient temperature is

more stable and comfort is improved in heating mode.

^{*} Width of multiple units includes clearance of 200mm (7-7/8") between units.

Commercial Multi-Zone Systems

Reznor VRF heat recovery condensers are available in 6, 8 and 10 Tons. Indoor unit combinations range from 12 indoor units all the way up to 20 indoor units. The minimum and maximum number of indoor units

is determined by the system's connectable capacity. The connectable capacity range for heat recovery is 50% to 135% of the capacity rating of the outdoor unit. The collective capacity rating of indoor units must fall within the connectable capacity range. Over or under and the system won't work at all.

EER of common system ξ1=13.0/3.0=4.33

COP of common system ξ2=17.0/5.0=3.4

High-Efficiency

The Heat Recovery System has all the benefits of DC inverter technology,

- DC fan linkage control
- Precise control of capacity output
- Balancing control of refrigerant
- Oil balancing technology with high pressure chamber
- High-efficiency output control
- Low-temperature operation control
- Super heating
- High adaptability for unique applications
- Environmental refrigerant

Its energy efficiency is improved by 78% compared with conventional multiple VRF units.

V5 Heat Recovery Outdoor Units

Dimension (WxDxH) Package		inch	56 x 33 x 69-7/8					
Net Weight/Gross Wei	ght	lbs	666/699	683/716	794/827			

When the cooling capacity and heating capacity of common system are equivalent to the capacity of a heat recovery system, its energy efficiency ratio is:

2=(13.0+17.0)/(3.0+5.0) = 30.0/8.0 = 3.75

The energy efficiency ratio of a heat recovery system is higher than a common system or common systems:

(6.67-3.75)x100%/3.75 = 78%

Note: Working conditions of above-mentioned test: outdoor temperature 45°F/43°F (7°C/6°C), indoor temperature in cooling 81°F/66°F (27°C/19°C), indoor temperature in heating 68°F/59°F (20°C/15°C).

Individual Control for More Energy Savings

The set temperature of each room may vary by the individual thermostat control of each indoor unit.

The cooling and heating operation can be performed simultaneously.

55°F (13°C) 59°F (15°C) 68°F (20°C) 72°F (22°C) 79°F (26°C) OFF

Intelligent Quiet Function at Night

The Night Quiet function adjusts the overall capacity of the outdoor unit, reducing the overall noise by 8dB(A), reducing noise production to as low as 50dB(A) at night. For example, when most occupants are returning home from work in the evening, they adjust their thermostats, sometimes by many degrees. This will cause other VRF systems to ramp up to 100% immediately, producing a large amount of noise. This function prevents a sudden increase, therefore reducing noise.

Low Noise Design

High-side shell compressor has lower exhaust pressure fluctuation so sound is significantly reduced.

The optimized design of the condensing fan blade reduces the airflow turbulence through the blades. Lower turbulence means quieter operation.

Wide Operating Range

The unit can operate in a wide range of ambient temperatures.

Note: If the total capacity of indoor units is 50% lower than outdoor unit, cooling range drops to 5°F (-15°C). If the total capacity of indoor units is 50% higher than outdoor unit, cooling range raises to 23°F (-5°C).

No External Oil-Balanced Design

The heat recovery units don't require an external oil-balance pipe, reducing system pipe connections for easier installation. The system will allocate lubricating oil to each module according to its demand, for a more intelligent, more efficient and more equal distribution.

5-Way Piping Connection

Piping and wiring connections can be made to the front, back, left, or right side of the unit or to the bottom.

The 5-way piping connection makes installation easier resulting in lower installation cost.

V5 Branching Units

Model			V5BV-R1K	V5BV-R2K	V5BV-R4K			
Maximum Indoor Units	Unit	1	4					
Number of Connectable Indoor Ur	nit of each Port	Unit	8	8	8			
Total Connectable Indoor Unit		Unit	8	16	32

Outdoor Unit Piping Connection	Gas (Low Pressure)	inch		7/8				
Commodition	Gas (High Pressure)	inch	5/8	3/4	1-1/8			
Indeer Unit Dining Connection	Liquid	inch	3/8					
Indoor Unit Piping Connection	Gas	inch		5/8				

Mode Exchange Unit (MEU)

Connects before each indoor unit, performs the function of real-time operation mode exchanging (cooling to heating, heating to cooling).

All MEU's contain the same Control boards, reducing the need for stocking multiple replacement boards.

Internal Structure 1 to 4 MEU

Multi-port boxes have inlet and outlet connections, no Y-branches are needed to connect these MEU's.

Internal Structure 1 to 1 MEU

Internal Structure 1 to 8 MEU

V5 Indoor Units

Ducted Type, Cassettes, Wall Hung, Floor Ceiling and Console Type Units

Reznor indoor units provide high efficiency and tremendous energy savings. These commercial grade inverter fan coils incorporate the most advanced heating and cooling technology available in the industry today. Inverter technology provides soft starting with super quiet operation and superior comfort over traditional air conditioning systems. These indoor units can be mixed and matched in thousands of combination to meet all load, air distribution, comfort, and décor demands.

V5 Indoor Units

V5 Indoor Unit Nomenclature

Floor Ceiling

High Static Pressure Ducted Type Indoor Units

High Static Pressure Ducted Type Indoor Unit with Condensate Pump

High Static Pressure Design

Static pressure can be up to 150Pa, making it ideally suitable for buildings where long distance airflow is required.

Ease of Maintenance

The system has maintenance port for easy access maintenance, service and repair. Basic washable filters.

Intelligent Condensate Drain

Intelligent condensate drain pump can effectively drain up to 39 inches in height, saving space. Pump included in up to 54k Btu units.

Flexible Installation

This indoor unit can be installed with circular or rectangular air duct. Different styles of return air duct can also be selected based on building requirements.

Protection Function

- Freeze protection
- Fan motor overload
- Temperature sensor malfunction
- "Premium" Wired controller (WRC1) included

⁽¹⁾ No condensate pump

Low Static Pressure Ducted Type Indoor Units

Low Static Pressure Ducted Type Indoor Unit

Quiet

Provides a comfortable and quiet environment. It's especially suitable for smaller rooms or where installation space is limited.

Intelligent Condensate Drain

Intelligent condensate drain pump can effectively drain up to 39 inches in height, saving space. WRC1 controller included. Basic washable filters included.

Easy Installation and Maintenance

Several features have been included in this model for easy installation and maintenance including

- Tabbed plastic filter
- Detachable fan motor
- Independent water pump assembly
- Electrical box assembly

Protection Function

- Freeze protection
- Fan motor overload
- Temperature sensor malfunction

Strong and Balanced Airflow

The 4-way airflow unit features auto operation, seven fan speeds and strong airflow.

Ultra Quiet Operation

DC inverter motor offers stepless speed regulation for quieter operation. The wired controller can be set to normal operation or auto quite mode.

Intelligent Condensate Pump

Condensate water can be pumped up to 39 inches vertically from indoor unit.

DC Inverter Motor

The DC inverter motor improves efficiency 30% vs conventional motor. Increased efficiency reduces operating costs.

4-Way Compact Cassette Indoor Units

Fits in a standard 2-by-2 ceiling grid.

Strong and Balanced Airflow

The 4-way airflow unit features auto operation, seven fan speeds and strong airflow.

Ultra Quiet Operation

DC inverter motor offers stepless speed regulation for quieter operation. The wired controller can be set to normal operation or auto quite mode.

Intelligent Condensate Pump

Condensate water can be pumped up to 39 inches vertically from indoor unit.

DC Inverter Motor

The DC inverter motor improves efficiency 30% vs conventional motor. Increased efficiency reduces operating costs.

Protection Functions

- Freeze protection
- Fan motor overload
- Temperature sensor malfunction

The noise level is measured under the standard test condition. The noise level is measured under the condition of rear air return.

These units are used in larger rectangular spaces, such as hallways and offices. Units have adjustable louvers to ensure customizable air distribution. This can help prevent cold drafts for office occupants.

Attractive Appearance

The elegant, attractive front panel coordinates nicely with the indoor decor.

Intelligent Condensate Pump

Condensate water can be pumped up to 39 inches vertically from indoor unit.

2-Way Airflow Design

The 2-way air outlet improves airflow providing comfort and even air distribution in more elongated rooms.

Protection Functions

- Freeze protection
- Fan motor overload
- Temperature sensor malfunction
- Humidity
- Free panel included

^{*} The noise level is measured 1.4 meters from the bottom center of the unit, in the semi-anechoic room. It will be slightly higher due to change of the environment during actual operation. The noise level is measured under the standard test condition. The noise level is measured under the condition of rear air return.

Up & Down Air Outlet

During summer, cool air is supplied horizontally through the upper air outlet. Cool air entering the room will drop to the floor.

During winter, warm air is supplied downward through the lower air outlet. Warm air is directed toward the floor where it is needed. Warm air will then rise for even heating.

Triple Defender Filter

The electrostatic, anti-biotic fibre filter removes dust, odors, bacteria and mildew. Free controllers and filters.

Warm Air Design

During winter, the cold air prevention function is enabled so that the heater will warm before the fan is engaged providing warm air from the start.

Protection Functions

- Freeze protection
- Fan motor overload
- Temperature sensor malfunction
- Error code indicator

The noise level is measured under the standard test condition. The noise level is measured under the condition of rear air return.

Floor/Ceiling Type Indoor Units

Great for spaces requiring great air-throw with limited installation locations.

Flexible Installation

Floor ceiling unit can be mounted overhead in a hoisted position or may be mounted in seated position on the wall, close to the floor.

Attractive Appearance

The elegant, attractive front panel coordinates nicely with any décor.

Condensate Pump

Convenient space provided for condensate pump installation.

Protection Functions

- Freeze protection
- Fan motor overload
- Temperature sensor malfunction
- Horizontal and Vertical Air Swing
- Provides a wider air swing range for a comfortable working and living environment.

Floor/Ceiling Type Indoor Units

9K to 48K BTU - 60 Hz

The noise level is measured under the standard test condition. The noise level is measured under the condition of rear air return.

Console Type Indoor Units

Great for radiator-type and knee-wall installations, like finished attic spaces with low walls.

Multiple Fan Speed

Adjustable fan operates in multiple speeds and satisfy different airflow volume requirements.

Detachable Grille and Long Life Filter

The front grille is easily detachable for easy filter cleaning. A durable, long-life, washable filter is included.

Protection Functions

- Freeze protection
- Fan motor overload
- Temperature sensor malfunction

^{*} The noise level is measured 1/16 inch from the bottom center of the unit, in the semi-anechoic room. It will be slightly higher due to change of the environment during actual operation. The noise level is measured under the standard test condition. The noise level is measured under the condition of rear air return.

VRF Accessories

VRF Accessories Simplify Installation

Reznor offers a complete line of accessories to meet the requirements of any job small to large.

- Selection Software
- Fresh Air Processing
- Commissioning Software

VRF Selection Software

The Reznor VRF Selection Software is an advanced computer program that accurately selects models based on your customers' needs. It integrates VRF Selection Logic, Piping Rules, and unit limitations in an easy-to-use user-friendly interface, eliminating the headaches of manual equipment selection. The software produces an error-free and organized spreadsheet to pass along to your customer.

VRF Selection Software (continued)

Flexible Setting of Project Design Conditions

When setting up a new project simply enter the customer, designer, and unit series information. This will be output by the selection software in an easy-to-read format when the equipment selection is complete. Entering your design conditions will help the software accurately determine the size of equipment that is needed.

Project Setting

Confirmation

Indoor Unit Selection

Adding an indoor unit is simple: simply drag-and-drop the desired model from the left side onto the selection field. Then you double-click the unit to enter the required load and click "recommend" and the software will accurately select the size of the unit that is needed. Repeat these steps for all desired additional indoor units.

Add New Indoor Unit 1

Add New Indoor Unit 3

Add Y-Branches or Mode Exchange Units

In a Heat Pump System, you'll add Y-branches to distribute refrigerant to the indoor units. To add, simply drag-and drop a Y-Branch from the left side onto the selection field. In a Heat Recovery System, you'll add Mode Exchange Units. These enable simultaneous heating and cooling operation. Simply drag-and-drop a Mode Exchange Unit from the left side onto the selection field.

Add Y-Branches

Add Mode Exchange Unit

Flexible Piping Connection

To connect your piping in the software, simply click on a unit and then click on a Y-Branch, Mode Exchange Unit, or Outdoor Unit. This simulates the piping connections in your systems. Accurate piping lengths are important in design, so you'll double click on a piping run and enter the length. This information will let you know how much additional refrigerant charge will be needed at commissioning and lets the software know if maximum piping lengths have been exceeded.

Add Piping

Add Piping Length

Outdoor Unit Selection

Once you have selected all of your Indoor Units, Y-Branches, Mode Exchange Units, and you have entered you piping lengths, double-click on the outdoor unit. Click "Recommend" and the Selection Software will automatically select the unit best suited for your application. You can also change the desired connection ratio and static pressure for your Outdoor Unit.

Outdoor Unit Selection 1

Automatic System Checking and Output

To automatically check for errors, click "Check," select your system, click "OK," select "Adjust ODU Only," click "OK," and you'll be prompted with a "Checking Completed" message. If you do have an error or if a change was automatically made, you will be notified and you will not be able to send your customer a report with errors.

Automatic System Check 1

VRF Accessories - Fresh Air Processing

Fresh Air Processing Indoor Unit

Airflow volume: 1150 - 1800cfm

One System, Two Functions

Adopted with DC inverter technology, Fresh Air DC Inverter Multi VRF System features air conditioning function and fresh air function.

Applications include:

- Residential houses
- Villas
- Office buildings
- Hotels
- Apartments

Enjoy Fresh Air

Airflow volume: 1150 - 1800cfm, cooling capacity: 6 - 8 Tons

Applicable for all types of structures.

Direct evaporative cooling + air conditioning + fresh air can be generated accurately and precisely.

DC inverter technology, constant humidity control with less power consumption.

Integrated system control with Multi VRF System.

VRF Accessories - Fresh Air Processing

Air Conditioning and Fresh Air, Two-in-One

Lower Installation Cost

Fresh Air DC Inverter Multi VRF System can be combined with Reznor V5. Fresh air unit is roughly equivalent to the cost of V5 + Air exchange fan.

Lower Operating Cost

Unit can control refrigerant output according to actual needs to ensure constant airflow temperature. By adjusting power output, full load operation can be avoided when only partial load is needed. Thus, operation cost can be greatly reduced.

Less Installation Space

With the combined connection design less space is required for outdoor units. Ideal for applications where roof area is a premium.

6 to 8 Ton - 60 Hz

Reznor VRF controls come in many different styles to suit any application. Standard controllers include wireless remote and wired controllers. Also available are optional centralized controllers with 32 and 255 unit connection capability, long distance monitoring, BACnet, and Modbus Gateways.

Wired Controllers

Modbus Gateway

BACnet

Wireless Remote

Commissioning Software - Auto Direction of Connection Path

The wiring diagram will direct connection path automatically, so that the user can determine the connection path quickly.

Multiple Intelligent Remote Control Management

Visualized Management

System provides a map that can display air conditioners' locations in rooms and buildings.

System is able to measure the status and number of air conditioners in different levels.

Everyday Management

Setting for Daily Operation

- a. Management in days/weeks/months/years
- b. Management in each unit
- c. Simple display for management

Other Functions

- a. Power on/off, modes, humidity, fan speed
- b. Auto shut-off can help prevent waste of energy that may be caused by forgetting to turn off the air conditioner

Everyday Management at Different Locations

- a. Management for overtime hours
- b. Management for meal breaks
- c. Management for normal working hours

Group Management

Central Management in Groups

- a. Free choices of dividing groups
- b. Central control over power on/off
- c. Central control over temperature
- d. Central control over modes
- e. Central control over user authority

Authority Management

Only for Indoor Units

- a. Limited control over power on/off
- b. Limited control over temperature
- c. Limited control over modes

Allows managers to limit employee access

Statistical Analysis

Recording Statistics

System can self generate graphs of statistics for easy management and analysis.

Recording Errors

System can show the information of errors in charts and send alarms of errors through emails.

Recording Operation

System can record users' daily operation.

VRF Controls - Debugging Software

Intelligent Debugging Software

V5 offers intelligent debugging software to the end-user to assist in commissioning the system at a fraction of the cost of our competitors' service tool.

Monitoring Functions

- Fully control the operational status of each device of the system
- Hover the mouse over the parameter to display its remarks
- The online devices will be displayed in a tree structure
- Display the information of air conditioner in divided regions
- Each display region can be moved or concealed
- Display updated status of units in real time

Control Functions

- Control the operation of unit to suit your needs
- Comprehensive control of outdoor unit, indoor unit, etc.
- Real-time display of current status or status after being controlled
- Both single control and group control are available

Project Debugging Functions

- One-click and automatic project debugging
- Project debugging is arranged step by step from left to right

Manual intervention and bypassing of some debugging phases are available.

Green icons will be displayed for the items finishing debugging; red icons will be displayed for the items having debug exceptions; light yellow icons display debugging information.

VRF Controls - Debugging Software

Intelligent Debugging Software (continued)

Auto Data-Saving Function

Data will be saved automatically. Database saving path can be changed or data document can be generated repeatedly.

Step 2: Database Save Setting

USB Data Converter

Users can use a USB data converter to freely convert CAN/HBS/RS485 data into USB data, achieving data interchange between computer and the air conditioner.

Calculating Cost of Electricity

Auto Calculation according to Users

- a. According to the operating time, modes, flow of refrigerant, humidity and other factors, system can calculate the cost of electricity for users in different locations.
- b. Detailed information of bills and operation data can be provided.

Energy Management

Analysis of Energy Cost

- a. Air conditioners that use excess energy
- b. Air conditioners that are set too low
- c. Air conditioners with poor cooling performance

Ways to Save Energy based on the following Aspects:

- a. Operating time
- b. Unit turned on too early
- c. Unit turned off too late
- d. Comfort
- e. Cost of electricity/cost of electricity per square meter

Energy saving

Limits on Electricity

- a. Analysis on the cost of electricity
- b. Set the maximum cost of electricity and unit will operate within set limits
- c. System can show users the cost of electricity during operation and give suggestions on energy saving.

Economic Operation

System is able to operate in selectable energy-saving conditions.

VIP Management

System can provide independent and unique service to VIP users.

There are two kinds of controllers: wired controller and remote controller. The system provides various controls for users, such as cooling, heating, dehumidifying and fan etc., giving users maximum flexibly according to their own using needs.

Wired Remote Controller WRC1

(standard version for ducted indoor unit type, optional version for cassette & high wall indoor unit type)

- LCD with black background and white words; touch buttons
- Clock can be displayed; 24 hour timer setting for on/off
- 7 levels of fan speed, up & down swing and left & right swing
- Can be switched in auto, cooling, dehumidifying, fan, heating, floor heating, 3D heating and space heating operation modes
- Master and slave wired controllers can be set; simultaneous control over several indoor units is available. Up to 16 indoor units can be controlled. If error occurs in these units, the controller can have the affected indoor unit produce an audible tone for easy identification.
- Available functions: sleep, ventilation, quiet/auto quiet, light, energy saving, auxiliary heating, drying, memory, low-temperature dehumidifying, absence in heating, controllable auxiliary heating in dehumidifying, filter cleaning reminder, etc.
- Detect ambient temperature; receive infrared remote controller signal
- With project parameters viewing and setting functions

Wired Controller (special order for hotel)

- With simplified functions, mechanical buttons, backlit LCD and convenient operation
- Can be switched in auto, cooling, dehumidifying, fan and heating operation modes
- Master and slave wired controllers can be set; simultaneous control over several indoor units is available
- Detect ambient temperature; receive infrared remote controller signal
- With system parameters viewing and setting functions
- 7 levels of fan speed, up & down swing
- · Door control system can be connected

REZNOR

FAN

MODE

SWING | ON/OFF

SLEEP

TIMER

ENTER CANCEL

FUNCTION

Wireless Remote Controller RC

(standard version for cassette indoor unit & high wall indoor unit, optional version for ducted indoor unit)

- Can be switched in auto, cooling, dehumidifying, fan and heating operation modes
- 6 levels of fan speed including Turbo Fan
- Available functions: child lock, drying, health, ventilation, turbo, sleep, light, absence, IFeel, and timer
- Clock display and indoor/outdoor ambient temperature viewing functions
- Up & down swing and left & right swing

Remote Controller (special order)

- Can be switched in auto, cooling, dehumidifying, fan, heating, floor heating, 3D heating and space heating operation modes
- 7 levels of fan speed, up & down swing and left & right swing
- Available functions: child lock, energy saving, drying, health, ventilation, quiet/auto quiet, sleep, light, absence, lowtemperature dehumidifying, IFeel, and timer
- With clock display, system parameters viewing and setting functions

Wired Controller

- Elegant appearance
- High-resolution color LCD
- Capacitive touch control; receive infrared remote controller signal
- Various timing functions: three weekly timers and one countdown timer can be set simultaneously; mode, temperature and fan speed can be preset in weekly timer
- Complete system functions; each function will be implemented in an individual page with interactive and humanized interface
- Various personalized functions, e.g. setting brightness and backlight time
- Sufficient viewing functions, e.g. viewing on/off status and aftersales service hot line

Single Control of One Unit

Each indoor unit has an independent controller.

Multiple Control of One Unit

One indoor unit can be controlled by two wired controllers at different places.

Central Control of Several Indoor Units

One wired controller can control as many as 16 indoor units.

Joint Control of Remote Controller and Wired Controller

Users can control one unit with two types of controllers: a remote controller which is convenient and flexible; or a wired controller which includes every function of an air conditioner.

Two wired controllers can control a group of 16 indoor units. Used in very large spaces.

The temperature sensor used for temperature detection can be designated.

Central Controller Smart Zone Controller CC-32

- 1280*800 high-resolution color LCD
- 7" capacitive touch screen for easy operation
- Shielding function of single unit, group and all indoor units (shielding on/off, mode, temp setting, etc.) "Shielding" prevents a user from changing certain functions as designated by the Central Controller.

- With various functions: centralized control (control all indoor units), group management (support DIY grouping), schedule management (setting of several schedules) and single unit control (on/off, mode, temp setting, fan speed, quiet, swing control, etc.)
- Provide naming of indoor units, selection of icons and personalized settings (setting background, backlight, etc.)
- Up to 32 indoor units can be centrally controlled
- Elegant and fashionable appearance
- Embedded installation in wall with projecting thickness only of 7/16 inch
- Connectable with network of indoor units or outdoor units
- Independent power supply in 110~240V wide voltage range
- With project setting, parameter viewing, malfunction record and access management functions

Central Controller CC-255

- 1280*800 high-resolution color LCD
- 7" capacitive touch screen for easy operation
- With project setting, parameter viewing, malfunction record and access management functions
- With various functions: centralized control (control all indoor units), group management(support DIY grouping), schedule management (setting of several schedules) and single unit control (on/off, mode, temp setting, fan speed, quiet, swing control, etc.)
- Shielding function of single unit, group and all indoor Units (shielding on/off, mode, temp setting, etc.)
- Provide naming of indoor units, selection of icons and personalized settings (setting background, backlight, etc.)
- Up to 255 indoor units can be centrally controlled
- Elegant and fashionable appearance
- Embedded installation in wall with projecting thickness only of 7/16 inch
- Connectable with network of indoor units or outdoor units
- Independent power supply in 110~240V wide voltage range

BACnet Gateway BAC-G

BACnet gateway kits MG30-24/D2(B) are intended to realize the data exchange between the air conditioning unit and BAS, and providing the standard BACnet/IP building interface and 8 I/O interfaces, one of which is the fire alarm signal interface. The status of the other 7 I/O interfaces is mapped to the specific objects of the BACnet/IP bus and can be defined by the user.

Applicable models: V5 All DC Inverter Multi VRF System.

- International standard BACnet/IP interface, which has passed BTL certification;
- Real-time monitoring of unit operation status, e.g. on/off, mode, temperature;
- Real-time response to the control of unit (on/off, mode setting and speed setting, etc.) by monitoring software;
- Monitor unit errors;
- Lock unit operation statuses, directing at all control functions of unit itself or a certain setting function;
- · Achieve cooling and heating temperature limitation functions;
- 8 DI/DO interfaces for receiving fire alarm signal and user's definition logic;
- Large storage capacity of unit operation data for up to 6 months.

Modbus Gateway

Modbus Gateway provides V5 system with the Modbus protocol interface when connecting to the Building Management System(BMS) in order to achieve central control and remote control over V5 system by BMS.

Applicable models: V5 All DC Inverter Multi VRF System.

- Real-time monitoring of unit operation status, e.g. on/off, mode, temperature
- Real-time response to the control of unit (on/off, mode setting and speed setting, etc.) by monitoring software
- · Control all the units switches of on and off
- Monitor unit errors
- One Modbus bus can support up to 255 gateways. One Modbus gateway can support at most 16 outdoor units (up to 64 modular outdoor units) and 128 indoor units
- Lock unit operation statuses, directing at all control functions of unit itself or a certain setting function
- Linkage control, supporting 5 DI and 5 DO for receiving fire alarm signal and user's definition logic
- CAN, RS485 communication ports are non-polar, convenient for construction wiring
- Achieve cooling and heating temperature limitation functions
- 100-240 VAC,50/60Hz wide voltage range, adapted to the power supply of each country and region
